

The expansion of **PROMAR's** plant in Zawiercie is the largest **investment in over 35 years of the company's history**, with a value exceeding PLN 100 million. This forms part of the company's long-term development strategy. It aims at building a strong and recognisable PROMAR brand on the European market and strengthen the company's position as a trusted producer of high quality additives for the food industry.

The expansion of PROMAR's production plant is directly related to three main product categories: **functional additives, coating systems and alginates**, which form the basis for the further development of large-scale production.

The investment involves the construction of a fully automated production facility and the development of modern warehousing and logistics infrastructure, which will result in a fivefold increase in the production capacity and an even higher standard of customer service.

The construction of **the production halls and warehouses will be completed in September 2026**. The work currently underway (April–May 2026) involves the interior finishing stage. This investment represents a breakthrough in PROMAR's history.
